

HACKATHON 2026 · WORKING DEMO

Banking you can talk to.

Hands-free, conversational banking for everyone: in English or Urdu, spoken or typed. No forms, no menus.

Bank while your hands are busy. And it finally works for the parents every app gave up on.

Hands-free voice

Every answer is a card

The AI never moves money

Team PAYO

THE PROBLEM

Every banking action is a stack of screens, taps and forms. So we bank only when we can stop and stare at a phone.

Hands wet, eyes on the road, a child on your hip. And the bank still asks you to read a menu and fill a field. For Ammi, 62, those screens are a wall. And the man calling her knows it.

This is the premise we built against, not research. We surveyed no one.

WHY NOTHING HAS FIXED IT

Every bank answers this with one more screen. A sixth screen helps nobody.

Menus assume reading

Nobody wants to browse a bank. You want to ask a question and get an answer.

Forms assume typing

An IBAN field needs both hands and all your attention. It is where the conversation ends.

Confirmations assume doubt

Under pressure anyone taps yes. Another tap changes nothing.

More screens are more friction for everyone, and still no protection for the people a scam call targets. The interface has to be **the conversation**, and the safety has to live **inside it**, at the moment money moves.

WHY NOW

The wallet was already in your hand. Only the voice was missing.

01

Urdu finally works

One sentence can mix Urdu, Roman Urdu and English and still get a spoken answer.

02

Wallets went mainstream

Paying a phone number is already how the country moves money.

03

The scam call scaled

Pressure arrives by phone. No banking app is near that conversation.

Qualitative claims. See the market slide for the figures we cite.

THE PRODUCT

PAYO is a bank anyone can talk to, hands-free, and every answer comes back as a card.

Tap the mic once. It listens, answers out loud, and keeps listening until the job is done. The voice carries the gist; the card makes every answer glanceable the moment you do look down.

46 capabilities

32 card types

English · Urdu · Roman Urdu

You say “send 1,000 rupees” and the PIN pad opens inside the conversation.

It asks which bank
Chips, not an IBAN field

The PIN opens in chat
No separate screen, ever

The receipt is a card
Spoken aloud, kept on screen

The account title is resolved before anything moves. The recipient is saved by nickname afterwards.

When a payment smells like a scam, PAYO asks one calm question, and a trusted contact holds the key.

One question, no lecture
“Yes” cancels the payment

Her son decides
On his phone, with his own PIN

Approved, then her PIN
Two people, one payment

Any user can add a guardian; the check-in thresholds adapt by age. A guardian is needed above Rs 1,00,000, or for a new recipient at Rs 20,000, or when a pressure flag applies.

MAGIC MOMENT 03 · YOUR LANGUAGE, YOUR PACE

In Urdu, hands-free, it tells you what changed before you think to ask.

The whole app flips

Right-to-left Urdu, instantly

It speaks first

“Since you were last here”

Hands still work

A full wallet underneath

One mic tap starts the loop; it ends itself on silence. Every spoken action has a tappable equivalent.

WHY THIS IS SAFE TO PUT IN A BANK

The AI is just another customer of the bank. It proposes. The core disposes.

The model is allowed to be creative about **words**, never about **actions**.

THE ONE NUMBER THAT MATTERS

**The assistant can do everything the bank does.
It cannot move a single rupee.**

46

tools the assistant can call: the whole app, spoken

0

of them can move money on their own

2

minutes before a prepared payment expires, unexecuted

It never sees a PIN, never approves anything, and never touches the card number or CVV.

WHY THIS IS HARD TO COPY

The moat is everything we had to build around the model.

Urdu that routes

Three input languages in one sentence, graded row by row.

One card contract

Card shapes defined once, asserted on both sides. New surfaces ship in hours.

Safety built into the flow

Guardians, check-ins and cooling periods, each written after a failure.

A network that pulls

Every protected parent brings a son or daughter into the app.

THE MARKET

Pakistan has a banking–app problem at national scale, and it is the market we live in.

241.5M

people

Pakistan Bureau of Statistics, 2023 Census

~60%

national literacy rate

Pakistan Economic Survey, 2022–23

~21%

of adults hold a financial account

World Bank Global Findex, 2021

The wedge is every wallet user whose hands are busy, cooking or driving or carrying a child. On top of that sit the underserved: the people who cannot get through a form at all. Mobile wallets are already mainstream here, and voice-driven scams have grown with them. Both numbers move quarter to quarter, so we cite them live rather than print a stale one.

We want to be the way people talk to their bank, under its brand and rails.

Proposed 01

White-label the layer

A bank ships PAYO inside its own app, under its own brand and rails.

Proposed 02

Licence per active user

Priced on customers who talk to it each month.

Proposed 03

Fee on assisted actions

A share of payments completed in the conversation, not the branch.

No pricing has been tested with a customer. These are the three options we would pilot first.

WHAT IS BUILT TODAY

Three services, one app, and a routing gate we run before every demo.

844

tests passing across backend, AI and app

46

capabilities reachable by voice

32

card types, parity-checked against the app

67/70

rows passing on the last live routing run

- **Bank-aware send** end-to-end: chips, resolve, confirm, PIN in chat, save.
- **Guardian round-trip** proved live across two simulators.
- **Urdu** right-to-left and Roman Urdu input, verified on device.
- **Hands-free loop**: silence end, interrupt and PIN pause, with all QA items PASS.

WHAT THIS IS NOT YET

Everything above is real. Here is exactly what is not.

- **The world is seeded.** Balances, titles, bills and card numbers are deterministic fakes.
- **The institutions are simulated.** No rails, no settlement ledger, no KYC, no real SMS.
- **One platform.** Verified on the iOS simulator; Android has not been run in weeks.
- **Urdu trails English** by a turn on two flows, and routing stays probabilistic.

All of it is visible in the repo.

ROADMAP

Ninety days to make it feel like a phone call. A year to make it a bank.

NEXT 90 DAYS

Make the conversation disappear

- A wake word, so the mic tap goes away.
- Streaming duplex with echo cancellation, so you can interrupt mid-sentence.
- Read-back confirmation before the PIN sheet.
- Android parity; Urdu rows to full green.

NEXT 12 MONTHS

Make it something a regulator can sign

- Real KYC, real rails, a settlement ledger.
- Real SMS OTP; push for guardians, not polling.
- An audit trail on every gate decision.
- Rate limiting, request signing, secrets, a privacy review.

TEAM

Built by a small team that ships wallets for a living.

Team PAYO

Hackathon team

Between us: engineering on a production wallet platform. Retail and merchant wallets, cards, payment links, KYC.

PAYO as built: three services, one app, and the suites that keep them honest.

Who joins next

- **Urdu speech and NLP**: routing from ninety-something to boring.
- **Mobile**: Android parity, accessibility, and the wake word.
- **A bank partner**: compliance and rails we should not reinvent.

THE ASK

Give us one pilot: your wallet, your compliance team, our conversation layer.

One bank or wallet, one supervised cohort, ninety days. We bring the layer and the safety model; you bring the rails and the rules.
